

Habitats - The Ocean

Learn all about the animals that live in the Earth's **Ocean** with these fascinating facts!

.....

octopus

puffa fish

crab

starfish

turtle

dolphin

Ocean habitats are large areas of salty seawater. Rocks, mud, sand and seaweed make homes or hiding places for many underwater creatures.

Some creatures, like crabs, can breathe underwater. Others, like dolphins, swim to the surface and breathe air using a blowhole on the top of their head.

An octopus has a soft, squidgy body and eight limbs. They like to eat crabs and fish. Some types of octopus can be bigger than adult humans!

Puffa fish have very stretchy stomachs and can inflate their bodies by sucking in water or air. They do this to stop other sea creatures from trying to eat them.

Almost three quarters of the Earth's surface is covered with water. It's because of this that Earth is often called the "Blue Planet".
